

Riverton Mutual Seller Guide

Early Opportunity Progression Application Practice

Use this guide during both conversations with Leon Whitaker. Your goal is not to pitch an OpenAI product immediately or solve Riverton's claims operations challenge in one answer. Your goal is to keep the conversation anchored in the customer's workflow, ask useful clarification questions, and decide whether the opportunity has enough evidence to progress toward Stage 1.

Customer snapshot

Riverton Mutual Insurance is a mid-sized commercial property and casualty insurer serving regional businesses across the Midwest and Southeast United States.

Riverton has grown quickly after expanding commercial property coverage for logistics companies, regional retailers, and light manufacturing businesses. That growth has increased pressure on its claims organization.

The customer has expressed interest in “using AI in claims,” but the opportunity is still early. The problem may involve claim volume, intake, triage, adjuster preparation, consistency across regions, or backlog pressure. Do not assume the strongest use case too early.

Your task is to move from a broad AI interest signal to a clearer opportunity point of view based on qualification evidence.

Personas and priorities

Leon Whitaker, VP of Claims Operations. Your live customer in both conversations. Leon wants a practical path that could help the claims organization handle pressure more consistently without creating unnecessary risk or turning into a large transformation effort.

Other stakeholder concerns may come through Leon. Claims operations, claims systems, data, security, and legal teams may need confidence around source materials, system access, sensitive claim information, review expectations, and ownership before the opportunity can move forward.

Conversation 1: Clarify the workflow before making a recommendation

In the first conversation, avoid jumping straight to product routing. Leon has urgency, but urgency is not the same as opportunity readiness.

Listen for the difference between a broad symptom and a specific workflow problem.

A broad symptom might sound like: “Claims teams are overwhelmed.”

A more useful workflow problem might sound like: “Adjusters spend too much time piecing together claim context before they can decide the next step.”

As you talk with Leon, try to understand:

- Where the friction appears in the claims workflow.
- Who is affected by the problem.
- What teams do today to manage the work.
- Where delays, inconsistency, rework, or risk show up.
- What business impact the problem creates.
- What evidence is still missing.

You do not need to diagnose the entire claims organization. Stay close to the workflow Leon is describing.

Conversation 2: Recommend whether the opportunity should progress

In the second conversation, Leon needs help deciding what should happen next. Do not treat this as a prompt to deliver a polished product pitch.

Your job is to make a seller-level judgment: is the opportunity ready to progress toward Stage 1, conditionally ready with clear validation needs, or not yet ready?

Base that judgment on the evidence Leon has shared. Look for signals such as a clear business problem, an identifiable workflow, a stakeholder owner, a plausible value hypothesis, and enough customer engagement to justify structured follow-up.

If a solution route comes up, keep it at three seller-level decisions. First, identify the user or product surface: ChatGPT, Codex for software engineering, or an application or process built with the API. Within ChatGPT, distinguish collaborative Chat from delegated ChatGPT Work where available. Second, identify the required capability or architecture, such as retrieval, extraction, classification, review, connected tool use, or multi-step agentic work. Third, identify deployment and operating requirements, such as hosted or embedded execution, identity, permissions, approvals, retention, logging, and human review. Treat agentic behavior, open-weight deployment, and a combined solution as requirements or design choices to validate—not peer product answers. You do not need to design the architecture or resolve every governance question.

A useful next step should help Riverton clarify the opportunity, involve the right stakeholders, and validate the remaining unknowns before deeper solution design.

A useful mindset

- Start with the workflow, not the product.
- Treat “AI in claims” as a signal, not a fully qualified opportunity.
- Ask what is happening today before explaining what OpenAI could support.
- Connect the problem to business impact, not generic productivity.
- Keep readiness gaps visible.
- Know when to bring in technical, data, security, legal, or deployment specialists.

Watch out for

- Do not lead with “AI will automate claims.”
- Do not suggest AI should make final claim decisions. OpenAI Usage Policies prohibit automating high-stakes insurance decisions without human review.
- Do not recommend a broad claims transformation as the first step.
- Do not name a product path before the workflow evidence supports it.
- Do not treat all claims-related problems as equally ready.
- Do not make exact ROI, cycle-time, cost-savings, or performance claims without validation.
- Do not turn the conversation into technical architecture or deployment design.
- Do not skip source materials, data access, review expectations, stakeholder ownership, or success evidence.
